In honor of Day (March 14 a.k.a. " 3.14 "), calculate the area (approximate) of the circle above.

Use two different methods. One method requires the use of , the other method does not. (Use 3.14 as an approximation of in your calculations.)

Explain the two methods you use.
How close are your two calculations? Include an explanation - Which method was easier to use? Which method do you think is the most accurate?
